

Black Belt Project Feedback

Ninja Name & Location	Pallavi Shanmugam (Marda Loop, Calgary, AB)
WebGL Link	https://cnmlunity.github.io/The-Diamond-Heist/

Feedback Round #2 – November 25th, 2025

Bugs (things to be improved)

Overall Game Play

- On the last level, the NPCs don't respawn with you when you die and they are in front of you and you can't escape them

UI / UX

- I like the redesign of the title screen, but still make sure everything is centered and big
- Clean up the UI within the game. For example, instead of touching a purple cube at the end make it a cool purple portal.

Whomp-whomps! (things that are missing)

- Add more elements to the overall obby - like disappearing stairs or moving platforms - to increase engagement and variety.
- Add some background music/ sound effects specific to each level
- Add animation to the hammer and or the gun so you don't have to touch the box to activate and you can just point and click
- Make guessing the code slightly more challenging and make it so the player has to type in a code on a keypad rather than touching an option with the code on it
- In the last step make it more difficult rather than just one turn and then you are at the purple cube

Feedback Round #1 – November 4th, 2025

Hi-yahs! (things that are awesome!)

- I like how there are different mechanics and each level feels unique.
- The variety in gameplay keeps it interesting and fun.

Bugs (things to be improved)

Overall Game Play

- The camera POV is too close, making it difficult to control pineapple. consider moving it back for better visibility and control.
- The section of the obby with the tall wall feels too difficult. Try adjusting it to make it slightly easier while still challenging.
- The trivia question on Level 2 is too specific, Simplify the questions or provide hints to make them more engaging.

UI / UX

- Redesign the title screen with a cleaner layout:
 - Center the text.
 - Use bold fonts for the game name.
 - Make the buttons larger and more visually appealing.

- Apply a similar design approach to the instruction screen for consistency.

Code

- Make sure to organize your project into appropriate folders and subfolders. For example, there are a lot of materials and other assets sitting in the root folder.
- Make sure to remove any old or unused code. For example, empty start and update methods.
- Look for ways to reduce/combine code. For example, “Start Level” has separate methods for each scene change. This could be a single method that uses a string parameter.

Additional Info

- Based on what I looked up the 229th digit of pi is 2, which isn’t an answer option.

Whomp-whomps! (things that are missing)

- Add more elements to the overall obby (e.g., disappearing stairs or moving platforms) to increase engagement and variety.
- Add some background music
